## ONIXS UNVEILS SOLID FX MARKET ACCESS OFFERING

OnixS announces the availability of a calibrated FIX based market data and trading solution for the Solid FX currency trading platform.

Developed by Solid Trading B.V., Solid FX is a Foreign Exchange trading platform, providing deep liquidity in virtually every currency pair. Solid FX offers a transparent platform with a near zero latency matching engine, conforming to the business rules seen on regulated exchanges.

The OnixS Solid FX solution is a packaged software distribution that includes the OnixS selfConnect FIX engine, a calibrated and tested Solid FX FIX dialect variant implementation, and Solid FX specific reference implementation source code sample market data and trading client software for "out-of-the-box" testing for developers to quickly integrate with the Solid FX FIX API. Wayne Meikle, Commercial Director of OnixS said "We worked with Solid Trading and mutual customers to create this packaged Solid FX connectivity solution. The benefits are primarily two fold - to provide Solid FX customers with a proven and supported Solid FX trading platform access solution, and to provide Solid FX with a solution for rapid customer onboarding."

"We're pleased to work with OnixS to provide an "out of the box" connectivity solution to provide the most efficient onboarding process and best possible FX trading experience," said José Baptista, Director, Solid Trading B.V. "Solid FX is the only true multi-bank ECN based in mainland Europe, offering a single, reliable central counterparty for clearing and settlement combined with low latency, high reliability, full transparency and no execution fees. This solution makes us a highly attractive FX venue for existing OnixS customers, and offers an excellent Solid FX platform access solution for our own customers."
